Emerging Infectious Diseases

- EIDs have increased at more than four times the rate of prior decades

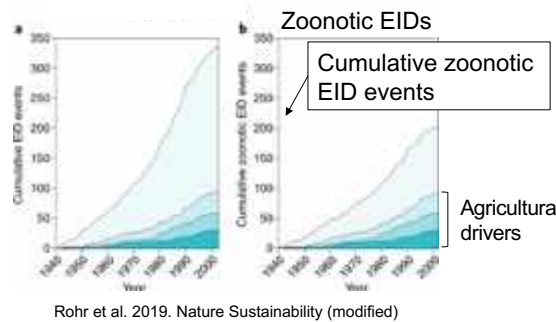

Jones et al. 2008. Nature

9

Emerging Infectious Diseases

- EIDs have increased at more than four times the rate of prior decades
- Since 1940, an estimated 50% of zoonotic disease emergence has been associated with agriculture

Rohr et al. 2019. Nature Sustainability (modified)

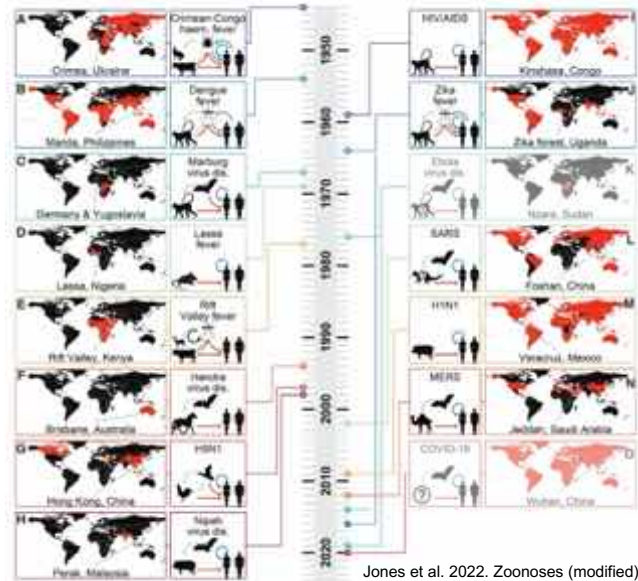

Jones et al. 2008. Nature

10

Major Human Diseases of Animal Origin

Jones et al. 2022. Zoonoses (modified)

11

Disease Ecology

- Wildlife is a source for pathogens with epidemic potential
- Livestock is contributing relatively more to zoonotic spillovers than wildlife
- Spillovers can also have positive effects

Data: Greenspoon et al. 2023. PNAS

Only 6% of the combined weight of mammals on Earth is wild

16

Zoonotic Livestock Diseases II

Table 2
Overview of micro-organisms reported in selected publications. The columns depict: the micro-organism; its uptake site; transmission pathway; mode of transmission of the micro-organism; and

Micro-organism	Animal involved
Antibiotic-resistant <i>Escherichia coli</i>	Pigs
Avian influenza	Chickens, layer hens, broilers, turkeys, wild birds
Avian metapneumo virus	Turkeys
Blastocystis	Pigs
<i>Brucella</i> spp.	Sheets, goats, "farm animals"
<i>Campylobacter</i> spp.	Cattle, dairy cattle, chickens, pigs
<i>Chlamydia psittaci</i>	Poultry, chickens, turkeys
<i>Coccidia</i> (various)	Goats, sheep, cattle, poultry, "farm animals"
<i>Cryptosporidium parvum</i>	Cattle, sheep, buffalo
Extended-spectrum β -lactamase producing Enterobacteriaceae	Poultry
Hepatitis E virus	Pigs, cats, chickens, deer, goats, horses, sheep
<i>Leptospira</i> spp.	"Farm animals"
Methicillin-resistant <i>Staphylococcus aureus</i>	Pigs, veal calves, poultry, cattle, broilers, sheep, horses, dogs, cats, rodents
Orf virus	Sheep, goats
Swine influenza	Pigs
<i>Trichophyton verrucosum</i>	Cattle
Verotoxin-producing <i>Escherichia coli</i> (VTEC)	Cattle, goats, pigs, dog
Not applicable/all zoonotic infections	"Farm animals"

* Livestock animals not specified, or all possible livestock animals studied.
 † All transmission possible, not specified in publications.
 ‡ All transmission pathways possible, not specified in publications.

Klous et al. 2016. One Health

- Antibiotic-resistant *Escherichia coli*
- Avian influenza
- Avian metapneumo virus
- Blastocystis
- *Brucella* spp.
- *Campylobacter* spp.
- *Chlamydia psittacosis*
- *Coxiella burnetii*
- *Cryptosporidium parvum*
- ESBL producing Enterobacteriaceae
- Hepatitis E virus
- *Leptospira* spp.
- Methicillin-resistant *Staphylococcus aureus*
- Orf virus
- Swine influenza
- *Trichophyton verrucosum*
- Verotoxin-producing *E. coli* O157

17

Emerging Infectious Diseases

- The **pandemic risk** from zoonotic livestock diseases must be seen in a global context

ILRI study shows that zoonotic diseases in livestock cause **2.3 billion human illnesses** and **1.7 million deaths/year**. →

Gilbert. 2012. Nature

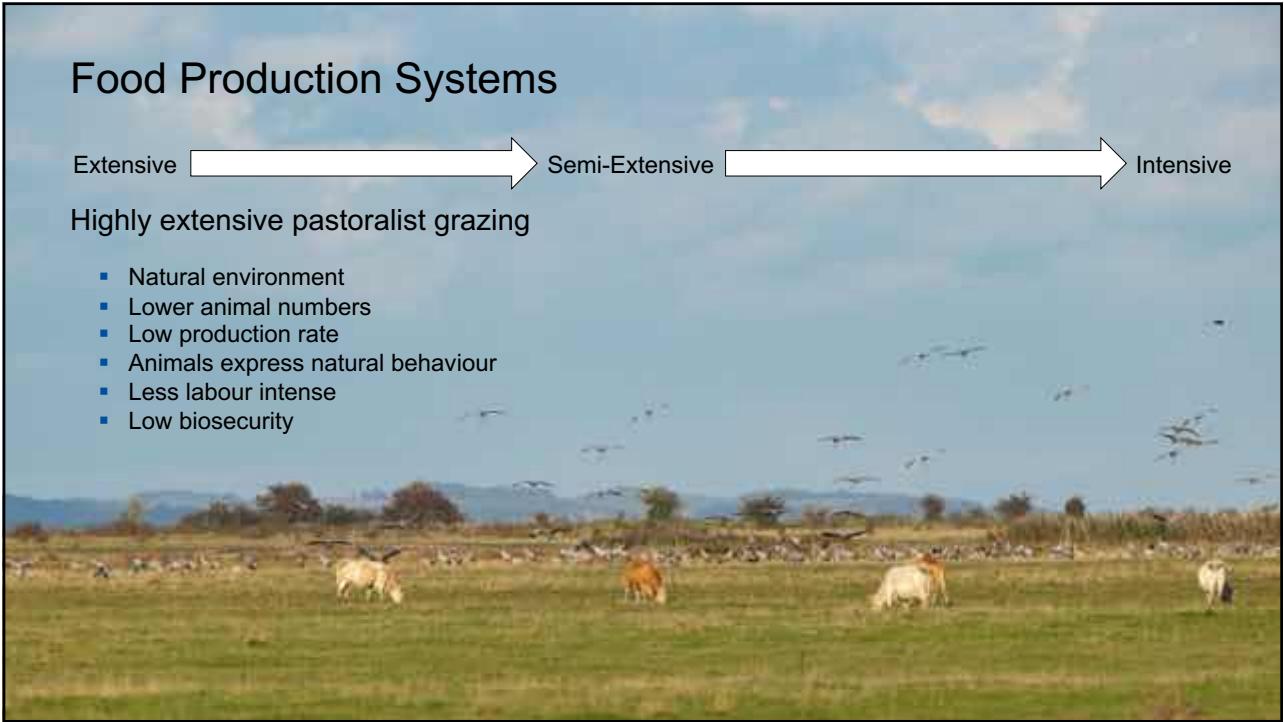

18

Food Production Systems

Extensive → Semi-Extensive → Intensive

Highly extensive pastoralist grazing

- Natural environment
- Lower animal numbers
- Low production rate
- Animals express natural behaviour
- Less labour intense
- Low biosecurity

19

Food Production Systems

Extensive → Semi-Extensive → Intensive

Landless, industrialised production

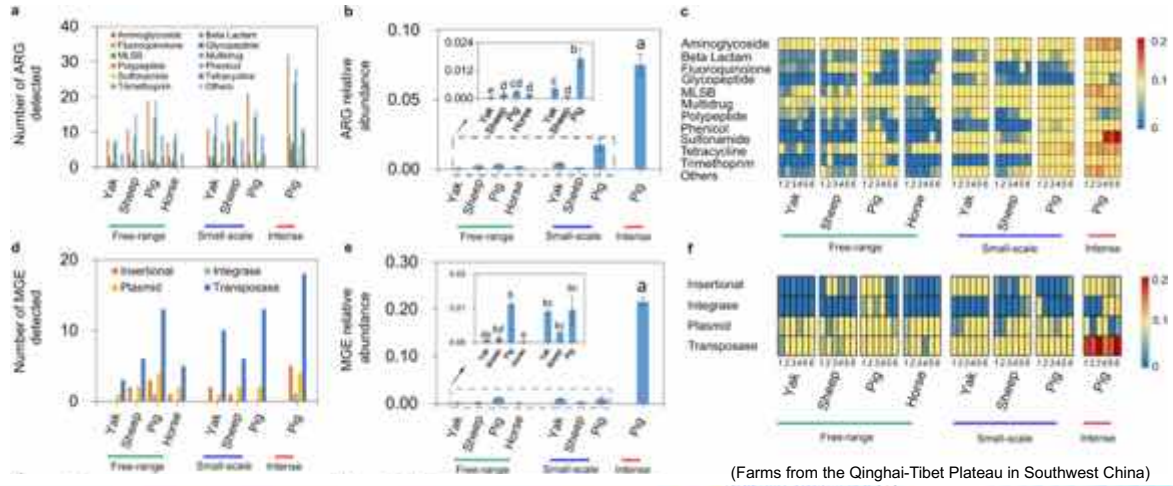

- Indoor housing
- Environment fully controlled
- Kept under high stocking density
- High production rate
- Close human contact
- High-biosecurity
- Intense veterinary care

<https://www.inrae.fr/en/reports/dairy-cows-grazing-future/dairy-farming-current-practices>

Integrated Poultry & Fish Farming

INTEGRATED POULTRY & FISH FARMING

June 1, 2019 & Dr. Ritesh Singh

INTEGRATED CHICKEN & FISH FARMING (AQUACULTURE)

By - Ritesh Kumar Pandey, PhD, IISWAT, ICRAR

pashudhanpraharee.com/

(...) Chicken raising for meat (broilers) or eggs (layers) can be integrated with fish culture to reduce costs on fertilizers and feeds in fish culture and maximize benefits. Chicken can be raised over or adjacent to the ponds and the poultry excreta recycled to fertilize the fishponds. Raising chickens over the pond has certain advantages: it maximizes the use of space; saves labour in transporting manure to the ponds and the poultry house is more hygienic. No significant differences have been observed on the chickens' growth or egg laying when they are raised over the ponds or on land. In case of the former, the pond embankment could still be utilized for raising vegetables. (...)

INTEGRATED CHICKEN & FISH FARMING (AQUACULTURE)

By - Ritesh Kumar Pandey, MSc, BSc, PhD

pashudhanpraharee.com/

Alles, was der passionierte Geflügelhalter braucht.

Die Reinfarm [redacted] liegt mitten im Herzen Mecklenburg-Vorpommerns. Umgeben von zahlreichen Seen, Wiesen und Wäldern werden hier seit mehr als 50 Jahren vor allem Entenbäckchen großgezogen und verkauft. Außerdem werden lebende Gänse, Hühner und andere Geflügel zum Verkauf angeboten. Unser Hofladen bietet Ihnen - von der Stallanrichtung bis zum Futter für die Tiere - alles, was der passionierte Geflügelhalter braucht.

In der Adventszeit gehen im Hofladen Enten und Gänse aus der hausgemachten Schlachterei als **traditioneller Weihnachtsbraten** über den Tresen. Unsere Enten und Gänse leben bis zur Schlachtung auf unseren bodengegenen Wiesen. So entwickeln sie festes und sehr schmackhaftes Fleisch.

FAO Scientific Task Force on AI in Wild Birds, Statement – July 2023

Zoonotic Tuberculosis

Biet et al. 2005. Vet. Res.

ZOONOTIC TUBERCULOSIS IS A MAJOR PUBLIC HEALTH THREAT

IN 2016

140,000 NEW CASES

12,000 DEATHS IN PEOPLE

POOR HEALTH AND WELFARE

REDUCED ECONOMIC PRODUCTIVITY OF LIVESTOCK

ACT NOW TO SAVE LIVES AND SECURE LIVELIHOODS

Zoonotic Tuberculosis

Example I: South-Central Spain

Significant risk factors for zoonotic TB

- Extensive production system
- High number of fenced big game estates ≤2km near to farm (reservoir system)
- High number of open game estates in vicinity
- Large farm size (spatial overlap with reservoir systems)
- High number of hunted deer (proxy for deer density)

Multispecies reservoir system →

Farm-level risk factors for the occurrence, new infection or persistence of tuberculosis in cattle herds from South-Central Spain

33

Intensive Animal Management Strategies

Evidence of zoonotic disease emergence

Elevated risks

- Indoor production and confinement
- Genetic homogenisation
- Subtherapeutic and growth-promoting antibiotic use
- Long-distance transportation
- Physiological stress from crowding, confinement, and conflict (e.g., gestation crates, veal crates, and battery cages)
- Temporary/seasonal and transient human labour
- Concentrated animal waste

Intensification

Increased risk due to farming (amplificatory and incubator process)

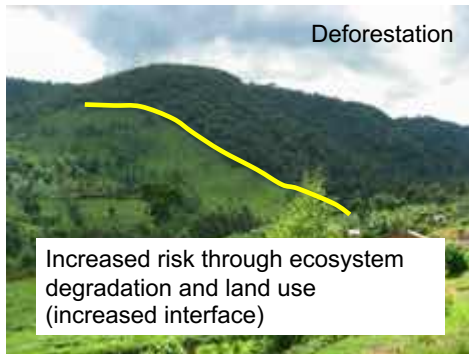

Commercial poultry farming, Ghana

Hayek. 2022. Science Advances (Review)

34

Intensive Animal Management Strategies

Bwindi Impenetrable Forest, Uganda

Evidence of reduced land and resource needs

Neutral or reduced risks

- Improving veterinary care and reducing mortality
- Improving animal husbandry management (e.g., lower reproductive age)
- Integrating crop and livestock production

In ruminants:

- Optimizing grazing densities
- Improving forage quality
- Amending and restoring degraded pastures

Hayek. 2022. Science Advances (Review)

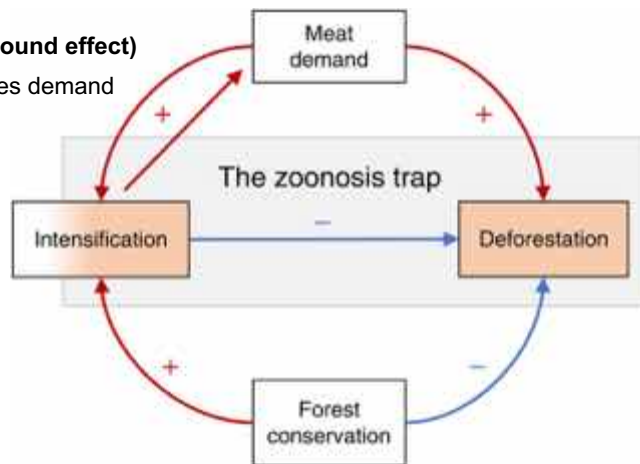

35

Intensive Animal Management Strategies

Jevon's paradox (rebound effect)

- Intensification creates demand (lower costs beget more consumption & production)

Hayek. 2022. Science Advances (Review)

36

Bio-Strategie 2030

30% increase in organic farming

Landless, industrialised production

- Indoor housing
- Environment fully controlled
- Kept under high stocking density
- High production rate
- Close human contact
- High-biosecurity
- Intense veterinary care

https://www.inrae.fr/en/reports/dairy-cows-grazing-future/dairy-farming-current-practices

37

Organic Farming – What to expect when we enlarge the interface?

Photos: Klaus Depner

Characteristic aspects of organic farming

- Outdoor rearing (→ increased contact with wildlife)
- Limited use of curative and preventive conventional medicine (→ increased susceptibility)
- Organic feed (→ risk of contamination)
- Incorporation of biological cycles within the farm (→ risk of recirculating infectious diseases)
- Increased land use

Kijlstra, A. & Eijck, I. A. J. M. 2006. J Life Sci

38

Organic Farming – What to expect when we enlarge the interface?

The global South as an information source for impact assessment

- ✓ Outdoor rearing
- ✓ Limited use of curative and preventive conventional medicine
- ✓ Organic feed
- (✓) Incorporation of biological cycles within the farm
- ✓ Increased land use

Massai Boma, NCA, Tanzania (2022)

39

i0.wp.com

- Dangerous interaction of two or more diseases in a population
- Leads to worse health outcomes

Classical examples in human health

- ❖ Flu and bacterial infection
- ❖ HIV & tuberculosis
- ❖ Syphilis & HIV

Under the One Health approach we should also include non-zoonotic diseases!

40

African Swine Fever – The Forgotten ‘Pandemic’

Data source: FAO
Empress-i

e.g. Viet Nam (2019)

41

The Socio-ecological and Economical Context

- Farmers are globally aware of livestock diseases
- After reporting an outbreak and subsequent depopulation
 - ❖ Only global North gets financial compensation for depopulation
- Consequences
 - ❖ Lack of reporting
 - ❖ Market sale of sick animals and products (further spread of disease)
 - ❖ Increases risk behaviour (e.g., bushmeat consumption)
 - ❖ No access to health care

42

One Health as a New Model

AZ Quotes

43

The Four Cs of One Health

OHHLEP (2021)

44

Communication

Authenticity and credibility

One Health is an ethical dilemma: Respect for all and harm for none?

- Conflicting interests
 - ❖ not always possible to act in the best interests of all
- Generally anthropocentric viewpoint
- How do we reach all levels of society?

<https://www.zeit.de/2014/21/tierversuche-versuchstiere-maues-ratten>

<https://www.sueddeutsche.de/bayern/bayern-vogelgrippe-bse-tierseuchen-1.6000365?reduced=true>

45

Collaboration

- One Health does not mean everyone or every institution is doing everything
 - ❖ We need specialists and generalists in all sectors
- Reversing conservative systems from competitive to collaborative
- Appreciation of the different research disciplines and depths
- Respectful and ethically correct
- Listen to the needs of your partner
 - ❖ Context specific

<https://ruinunes.com/wp-content/uploads/2022/06/3.png>

46

Tools to foster intersectoral collaboration

International Health Regulations (IHR)-Public Veterinary Service (PVS) National Bridging Workshop (NBW)

- Brings together stakeholders from the animal health and human health services within a given country

Impressions of the pilot rabies NB workshops (Ghana and Bali):

47

Coordination

One Health Lighthouse Projects

- Local, regional and global showcase projects that demonstrate the positive effect of One Health
- Not only in the academic world
- Innovative thinking (out of the box)
- The motivation to change something (crossing borders)

Universität Giessen und Friedrich-Loeffler-Institut berufen PD Sascha Knauf auf die Professur für One Health

(03.07.2023) PD Sascha Knauf, Ph.D., kommissarischer Leiter des Instituts für Internationale Tiergesundheit/One Health (ITG) am Friedrich-Loeffler-Institut, wurde zum 30. Juni 2023 auf die Professur für One Health mit dem Schwerpunkt Internationale Tiergesundheit an der Justus-Liebig-Universität Giessen (JLU) berufen.

<https://vet-magazin.de/>

W3 Professur für One Health/Internationale Tiergesundheit, Fachbereich 10 (Veterinärmedizin)

Nur die JLU hat alle One Health relevanten Fachbereiche unter einem Dach!

50

Capacity Strengthening

The inequity in One Health

- Many countries in the tropics are committed to the One Health thinking (*more than countries in the Northern Hemisphere*)
- Uneven distribution of resources
 - ❖ Imbalance of the health system
- Cross-sectoral collaboration only possible when all partners have basic equipment and training

Livestock Health 'Data Hub', Zanzibar 2022

51

Capacity Strengthening

In addition to our world-wide flexible support

- Establishment of two field presences (Africa and Asia)
- Equal partnership (involving all FLI institutes)
- Basic and applied sciences
- Sustainable training and education (Training-of-trainers, ToT)
- Local relevant – globally significant
- **One Health (Animal – Human – Environment)**

52

Root Causes And Long-Term Effects

Bow-tie model and the safety hierarchy

Lindout, P. et al. 2017. Safety Sci

58

What we can learn from the Global South

- Transforming traditional systems into intersectoral transdisciplinary workspaces
- National One Health Strategic Plans
- Information about emerging and re-emerging pathogens
- Data needed to evaluate the One Health approach

59

Integrated Wildlife Disease Surveillance In Europe

Integrated wildlife disease surveillance that combines data from disease surveillance, and the monitoring of wild populations and the biotic components of the ecosystem (adapted from Cardoso 2022).

- ENetWild-2 Consortium

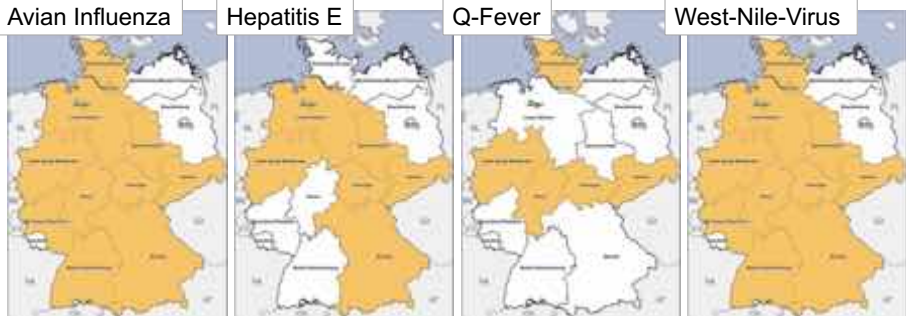

C. Staubach C. Sauter-Louis

60

One Health for Surveillance

Setting up a coordinated surveillance under the One Health approach (OH4Surveillance) in Europe

- Avian Influenza
- Hepatitis E
- Q-Fever
- West-Nile-Virus

Funded by the European Union
EU4H Project Grant

- Harmonized at international level
- Standardized procedures
- Widening of the scope

C. Staubach C. Sauter-Louis

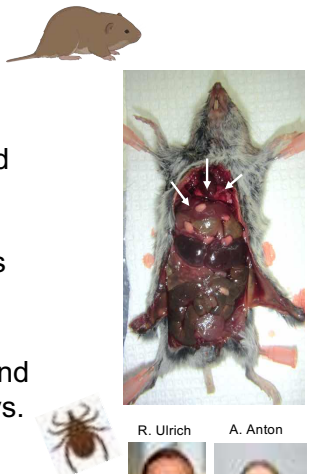

61

BEPREP

Identification of Best Practice for Biodiversity Recovery and Public Health Interventions to Prevent Future Epidemics and Pandemics

Funded by the European Union
2022 -2027

- Nature restoration targeting biodiversity recovery - isolated or in combination with public health interventions - has been identified as a major disease risk mitigation tool.
- Spatially and temporally replicated field studies and experiments
- 12 case study areas in Europe and the tropics

→ Identify causal mechanisms of infection dynamics and generate knowledge how to interrupt infection pathways.

R. Ulrich A. Anton

Water Sources

Kumasi, Ghana

- 2 L surface water/site per week
- 7 weeks sampling

Knauf et al. in prep.

- Antibiotic-resistant Enterobacteriaceae resistant to third-generation cephalosporins (ESBL-producers)
- High-risk clonal *Escherichia coli* lineages that are usually multi-drug resistant and highly virulent for humans and animals

Eger et al. 2024. JAC-Antimicrob Resist

64

Quadripartite's One Health Joint Plan of Action

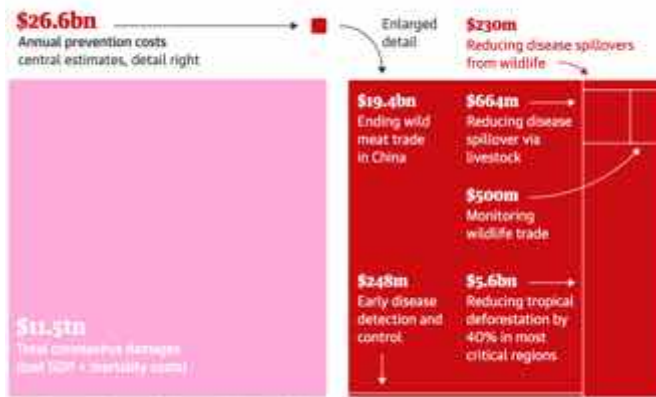

- Action track 1:** Enhancing One Health capacities to strengthen health systems
- Action track 2:** Reducing the risks from emerging and re-emerging zoonotic epidemics and pandemics
- Action track 3:** Controlling and eliminating zoonotic, neglected tropical and vector-borne diseases
- Action track 4:** Strengthening the assessment, management and communication of food safety risks
- Action track 5:** Curbing the silent pandemic of Antimicrobial Resistance (AMR)
- Action track 6:** Integrating the environment into One Health

65

The COVID19 aftermath

Annual costs of preventing future pandemics from wildlife are tiny compared with costs of the Covid-19 crisis

Guardian graphic. Source: Dobson et al., Science 2020

ITEM	VALUES (USD \$)
Expenditures on preventive measures	
Annual funding for monitoring wildlife trade (OTCE+)	\$290-\$750M
Annual cost of programs to reduce spillovers	\$120-\$340M
Annual cost of programs for early detection and control	\$20-\$270M
Annual cost of programs to reduce spillover via livestock	\$40-\$100M
Annual cost of reducing deforestation by half	\$1.5-\$5.5B
Annual cost of ending wild meat trade in China	\$10-40
TOTAL GROSS PREVENTION COSTS (G)	\$22.0-\$31.8 B
Auxiliary benefit of prevention	
Global cost of carbon	\$8.5/tonne
Annual CO ₂ emissions reduced from 20% less deforestation	12.0M
Auxiliary benefits from reduction in CO ₂ emissions	\$4.3B
TOTAL PREVENTION COSTS NET OF CARBON BENEFITS (G)	\$17.7-\$26.9 B
Damages from COVID-19	
Lost GDP in years from COVID-19	\$5.6 T
Value of a statistical life (V) reduced for COVID-19	\$5.54 M for \$104 M
Mortality structure	
Total COVID-19 world mortality (Q ₂) forecast by 28 July 2020; 50th percentile with 20% error bounds	890,847 (473,026-1,108,070)
Value of deaths in world from COVID-19 + Q ₂ + V	\$2.5 T
Lowest (50.34 M - 2.5th percentile mortality forecast)	\$1.1 T
Middle (80.7 M - 50th percentile mortality forecast)	\$1.8 T
Highest (100 M - 97.5th percentile mortality forecast)	\$3.0 T
TOTAL DISEASE DAMAGES (D)	
Lowest (\$1.14 M - 2.5th percentile mortality forecast)	\$4.3 T
Middle (\$1.14 M - 50th percentile mortality forecast)	\$5.8 T
Highest (\$3.0 M - 97.5th percentile mortality forecast)	\$10.8 T

Dobson et al. 2020. Science

66

Conclusion

- There is no magic in One Health
- Lead by example
- On the local, regional and global level
- Don't allow One Health to become a 'new' silo
- Be committed to 'Good Scientific Practice'
- One Health is politically supported (the momentum is now)

67
